

Cloud Deployment Summary Report

Regional Selection

Selected Region: Western Europe (Netherlands)

Rationale for Selection:

Compliance & Privacy: Utilizing this region ensures strict adherence to **GDPR (General Data Protection Regulation)** requirements, keeping data within the EU legal framework.

Performance: Provides optimal connectivity and minimal latency for users across the European continent.

Sustainability: Data centers in this region often utilize high percentages of renewable energy, aligning with corporate sustainability goals.

High Availability: This region supports multiple Availability Zones, allowing for a robust disaster recovery architecture.

The Shared Responsibility Model

The **Shared Responsibility Model** defines the boundary between the provider's duties and the customer's duties. This ensures that no security aspect is overlooked.

A. Responsibility of the Cloud Provider (Security OF the Cloud)

The provider manages the "foundational" security, which includes:

Physical Infrastructure: Security of the actual buildings, servers, and power supplies located in the Western Europe region.

Virtualization Layer: Maintaining the software that abstracts physical hardware into virtual resources.

Global Network: Protecting the high-speed fiber links that connect the Western Europe region to other global zones.

B. Responsibility of the Customer (Security IN the Cloud)

As the user, you retain control and responsibility for:

Data Sovereignty: Choosing to keep data in Western Europe and ensuring it is encrypted at rest and in transit.

Access Control: Implementing **Identity and Access Management (IAM)** policies to restrict resource access to authorized personnel only.

Operating System & Apps: Patching and updating the software running on your instances.

Firewall Management: Configuring **Network Access Control Lists (NACLs)** and **Security Groups** to block unauthorized traffic.

Conclusion

Deploying in **Western Europe** provides a high-performance, compliant environment for operations. By understanding the **Shared Responsibility Model**, we ensure that while the provider maintains the physical safety of the "cloud," we maintain the integrity and security of the "content" we place within it.
